
STUDY REPORT ON UMID APPLICATIONS PART 2-2

Additional Technologies Needed to be Standardized(2)

Page 1 of 18 pages

Executive Summary

The UMID (Unique Material Identifier) is a globally unique audiovisual material identifier standardized by SMPTE as SMPTE ST 330 and RP 205. Although more than a decade has passed since its initial standardization in 2000 and it has been widely disseminated over the industry by audiovisual products using the MXF and AAF technologies, its originally intended use as a unique material identifier to associate the material with its external metadata has seldom been seen in practice.

It has been revealed in the literature that this is because there is a lack of additional industry standardized technologies to realize such UMID applications. To address this issue, SMPTE TC-30MR Study Group on UMID applications was established on April 2012 with the project scope:

1. To explore the best practice of UMID applications,
2. To identify typical UMID application principles and collate the fundamental rules every UMID-aware product needs to adopt,
3. To identify relevant technologies needed to be additionally standardized.

The Study Group has produced its report on UMID Applications in three Parts:

- ✓ Part 1 dealt with UMID Application Principles and Best Practices
- ✓ Part 2 covers Additional Technologies requiring standardization
 - Part 2-1 dealt with UMID Resolution Protocol and UMID based Program Package Exchange
 - Part 2-2 (this report) deals with UMID Applications in MXF, the Domains of Media Identity and the preferred extensions on the UMID format specifications (SMPTE ST 330)

In order for the outcomes of each study report to be appropriately utilized to create relevant SMPTE engineering documents, an action to be taken for the next step is recommended to conclude the study report.

Table of Contents

1	Introduction	4
2	UMID Applications in MXF.....	5
3	The Domains of Media Identity	6
3.1	Introduction.....	6
3.2	Definition of Terms.....	6
3.3	Use Cases	7
3.3.1	Searching for Media Associated to Real or Fictitious Events.....	7
3.3.2	Finding the Best Media File/Instance to Act Upon.....	7
3.3.3	Searching for Media Containing or Contained Within Other Media	7
3.3.4	Finding a Suitable Alternative for an Instance of Media.....	7
3.4	Media Associations	8
3.4.1	Associating Media to Real or Fictitious Events.....	8
3.4.2	Identifying the Component Parts.....	8
3.5	The Identity Domains for Media [8].....	9
3.5.1	Event.....	9
3.5.2	Media	9
3.5.3	Material	9
3.5.4	Clone.....	9
3.5.5	Instance	9
3.5.6	Segment	10
3.5.7	Element.....	10
3.6	An Ontology for Media Identity.....	10
3.7	An Identity Example.....	11
3.8	Media Composition	11
3.9	Assigning and Maintaining Identity	11
3.9.1	When to Assign a New Media Identity.....	11
3.9.2	When to Assign a New Material Identity.....	12
3.10	Putting it All Together, Media Identity in Action.....	12
3.10.1	Searching for Media.....	12
3.10.2	Searching for Media Associated to Real or Fictitious Events	13
3.10.3	Finding the Best Media File/Instance to Act Upon.....	13
3.10.4	Searching for Media Containing or Contained Within Other Media	13
3.10.5	Finding a Suitable Alternative for an Instance of Media.....	13
3.11	Conclusion	13
4	SMPTE ST 330 Extensions.....	14
4.1	Introduction.....	14

4.2	Shooting Direction of Camera	14
4.2.1	Applications of Extended UMID	14
4.2.2	Proposal of Source Pack extension to accommodate the shooting direction of a camera.....	15
4.3	New Material Number Generation Method.....	15
4.3.1	Live feed with UMID	15
4.3.2	Proposal of new Material Number generation method.....	15
4.4	New Instance Number Generation Method.....	16
4.4.1	Applications of Instance number.....	16
4.4.2	Proposal of new Instance Number generation method.....	17
5	Recommendations	18
